

# Running with Friends: Digital Mockup

Erica Putsche, Heidi So, Luke Chang, Linsen Wu

## Mockup Overview

As illustrated above, each of the options in the main menu lead to a core feature of the application. Users can review their profile which contains recorded statistics from past runs, saved routes and saved groups. There are options to add and delete the routes and groups conveniently from the profile. To search for new routes, users can specify characteristics they are looking for, and browse the results page. After clicking on a result, they are taken to a detailed view of the route where they can browse/add reviews

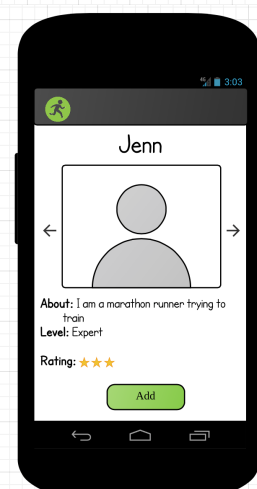

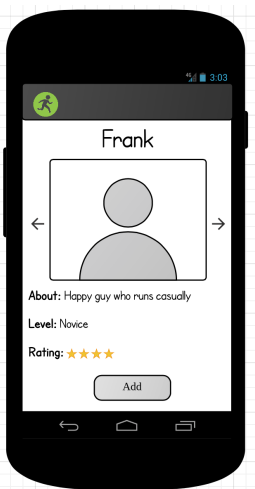

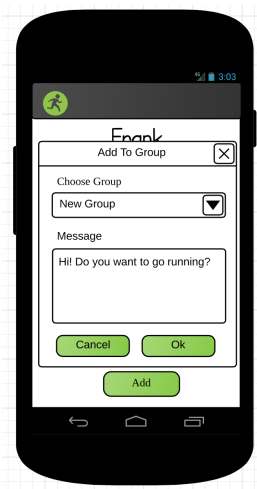

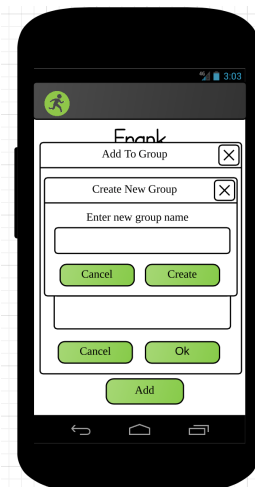

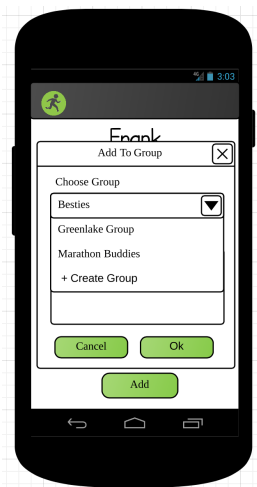

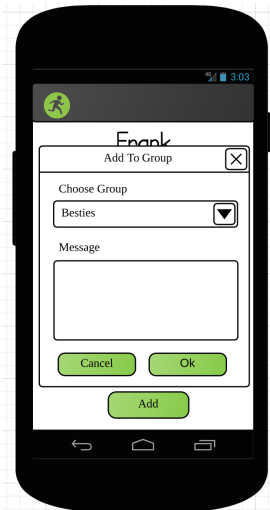

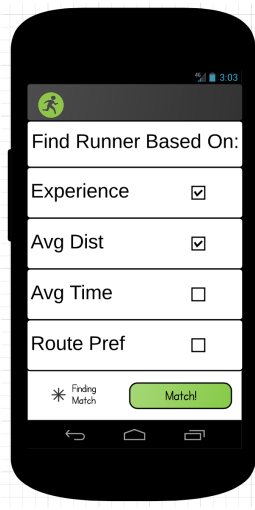

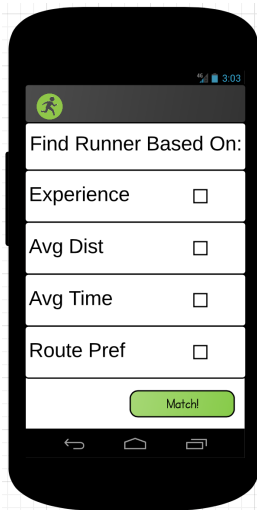

and also add the result to their saved routes. When a user wants to run in the near future with some friends, they can send a Siren to a group, signaling where and when to meet for the run. Friends who accept the Siren invite will appear in the Attending list. (Users also have the option to delete a Siren if needed.) The application also provides a matching feature called SmartMatch. The user specifies factors they want the feature to consider when computing their SmartMatches. The user can swipe through the results and add them to an existing or new group.

## Task Walkthrough

### Siren Friends

## Find a SmartMatch

## **Transitioning from Paper Prototype to Digital Mockup**

There were no significant changes to our design when creating our digital mockups. We did have to collectively decide on the color scheme, font, and design of the top bar and logo. Since we had the chance to flush out the design through our usability tests, we were able to translate our paper prototype pieces into digital form smoothly.
